

I- METHODOLOGY

The repertoires on the methods for impact assessment of climate change and adaptation strategies bring out four approaches. They are:

- Predictive models;
- Empirical studies;
- Judgment of experts;
- Experimentation.

The methodology used results from the combination of different aspects of experts' empirical studies of judgment, experts supplemented by interviews with resource persons. Unable to gather accurate statistical data for the study, and given that sources show that some estimates often contradicted others, the study had to resort at some moments to extrapolation techniques / or interpolation.
